0XKYC-1VOTE-

ARAGON-PLUGIN
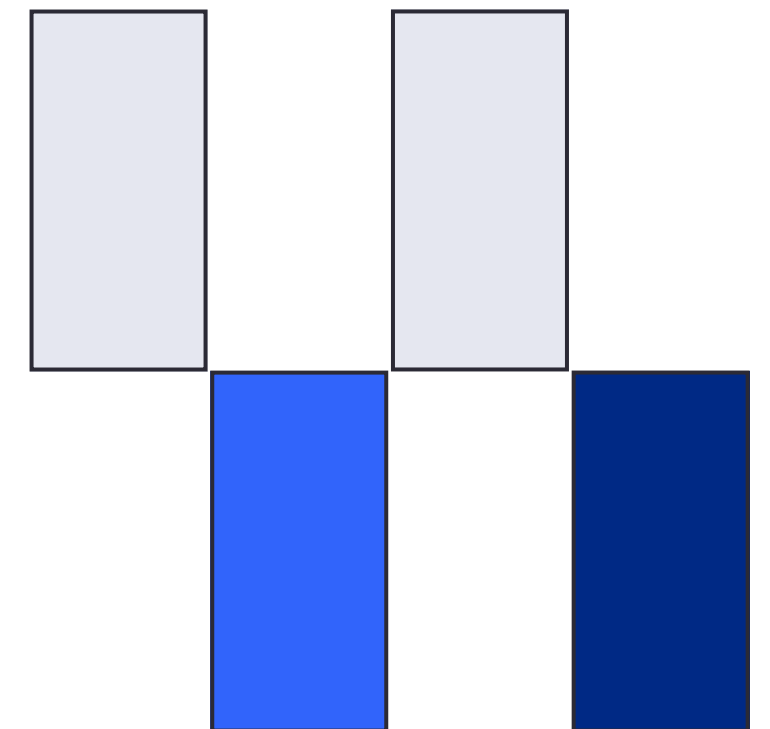

Zero Knowledge Private AML

check for Aragon OSx

Go to GitHub

Protocols have trouble identifying individuals on-chain

Users are creating multiple accounts abusing the voting mechanisms in DAOs, the traditional KYC solutions are not suited for anonymous Web3 communities due to 'doxing'

Our plugin enables DAOs to make decisions via Proof of Uniqueness

Our plugin allows protocols to decide how they manage sybil attacks/duplicated users, without revealing their personal information

How does Aragon 1vote-plugin work?

Connect to dApp

Connect any Web3 wallet and go through a KYC check via our trusted, market-leading 3rd party provider

Scan your ID + selfie

Data from your ID is compared against AML and Web3 fraud databases to generate a ZK proof + we generate a unique identifier for each user

Get verified and plug-in!

We generate your Soulbound Token with a proof that you are OFAC and Web3 verified ✔ Then you can use Aragon plugin to manage your users

We have a working app & OSx plugin

Read our public documentation here.

the use cases include:

- **DeFi**
- **DAOs**
- **Real Life / NSFW**
- **Gambling / Gaming**
- **Funds-in funds-out**
